Criterion E: Evaluation

Product Evaluation

An interview was held with the client on 14/11/2023 for gathering his feedback regarding the application. The interview transcript has been included in Appendix E1. Please refer to Appendix E1 for further details.

Success Criteria	Met/Not Met	Evaluation (based on Client Interview in Appendix E1)
The client must be able to switch between his	Met	The client talked about and praised

		five of his recent transactions in the
		home page.

delete existing transactions. Editing transactions will carry the same validation limitations (maximum amount being 100,000 and maximum transaction name length being 20 characters). In order to segregate transactions, the solution should have the functionality to create, edit, and delete transaction categories, and they should be less than or equal to 25 characters in length. The client must be able to filter transactions by their type (income/expense), category, date added and the magnitude of the amount. The implemented solution should display monthly transaction data in graphs (daily incomes/expenses, daily balance, and monthly categorical earnings/spendings). This data must be filtered by month and year. The application must be fully accessible and functional on both the client's MacBook and Windows desktops. The interface should maintain consistency across devices, ensuring that there is no loss of functionality between platforms.	The client must have the ability to edit or	Met	The client had stated his

reflected immediately in the application.		

The product has met client expectations (Appendix E1) through solving the problem identified in the initial interview (Appendix A1) by fulfilling the success criteria. However, a feature that could have been implemented differently in my opinion would be being able to create new categories in the home page using a modal, which would've increased convenience for the client as he wouldn't have to go to a new page to do so.

Recommendations for Further Development

Mr. Hari found the product satisfactory. However, given below are some recommendations for further development that I have come up with based on his feedback and along with my personal suggestions as well.

- 1. **Multiple categories:** The client expressed his wish for the ability to assign multiple categories to each transaction (one transaction can be assigned multiple categories instead of just one) to enhance transactions organization (Appendix E1). Implementing this requires adjusting the database schema to support many-to-many relationships between transactions and categories instead of the current one-to-many relationship system. This would lead to a more effective categorization system, allowing for more granular transactions filtering and categorization.
- 2. Recurring transactions: I would like to allow the client to set up recurring incomes/expenses (ex. salary, rent) that are automatically added to the 'transactions' collection in the database at the specified time periods. Implementing this would involve creating Firestore Cloud Functions to periodically create these transactions at the specified intervals. I believe this would be beneficial as it reduces the time spent in creating transactions (since Mr. Hari would not have to repeatedly make transactions that are made regularly), hence allowing for more convenient financial management.
